

**Environmental Restoration (ER) Project
Cerro Grande Fire
Accelerated Action Information Sheet**

**Potential Release Site (PRS) 02-004(c)
Underground Effluent Storage Tank**

Technical Area (TA)-2, located in Los Alamos Canyon, housed several reactors, including the Omega West, and Water Boiler Reactors. The reactors were shutdown, removed from the nuclear facilities list, and placed into the Laboratory's Decontamination and Decommissioning (D&D) program.

PRS History: PRS 02-004(c) is a 1,200-gallon stainless steel underground storage tank (Structure 2-55) used to hold radioactive wastes from the Omega West Reactor until they were pumped through waste lines to TA-50 for treatment.

PRS 02-004(c) is not listed on the Hazardous and Solid Waste Amendments module to the Laboratory's Hazardous Waste Facility permit. The ER Project has not proposed the site for no further action. There are indications of residual risk at the site.

Issues of Concern: The area upstream of PRS 02-004(c) burned during the Cerro Grande fire. The intensity of upstream burn was low to moderate. The site is a subsurface unit, and there is little potential for erosion. The site does not contain debris that could enter the flood watercourse. There are no longer any structures on the site that could interfere with or be impacted by flood mitigation efforts.

Accelerated Action Status: PRS 02-004(c) was evaluated after the Cerro Grande fire. In June 2000, personnel from the ER Project

and the D&D Group removed the tank and collected verification samples as part of the accelerated action process. The data has not yet been validated or reviewed.
